

## Energy-efficient Hopper Dryer

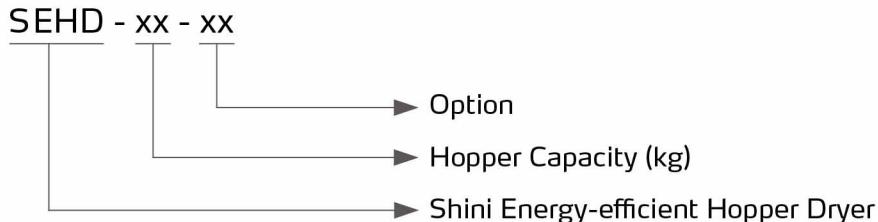

SEHD-200

Refer carefully to this manual before operation.

# SEHD Series

## ■ Coding Principle

## ■ Features

### Optimal structure

- Down-blowing structure design reduces the difference between inlet air temperature and heater temperature to ensure stable inlet air temperature.
- Adopt heat-insulated blower to prolong blower lifespan.
- The heating tank adopts double-layer insulation structure which not only can reduce the power consumption but also can avoid too high of the ambient temperature.
- All material contact surfaces are made of stainless steel to eliminate material contamination.
- Hopper separated from its base with cleaning door (except SEHD-12&25) for easy cleanliness.

Heat insulation blower

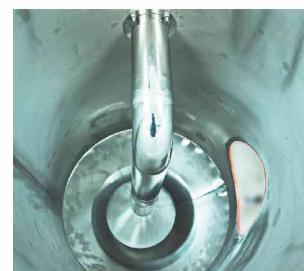

Down-blowing structure design

Cleaning door

Double-layer insulated hopper design

Internal structure

### User-friendly design

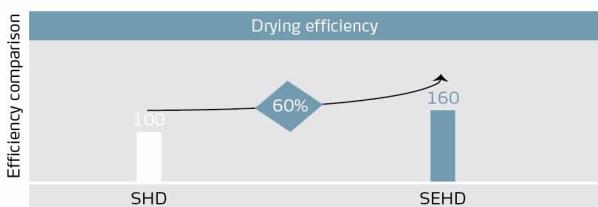

- SEHD-25-150 pipe heater with lead sheet connected and all series are equipped with the temperature protector as to prevent the pipe heater from dry burning.
- With overheat release function, when the drying temperature exceeds the set deviation value, the main power supply will be automatically cut off.
- All series are standard equipped with the one-week timer and intermittent operation function.
- All series are equipped with microcomputer control and RS485 communication interface.
- The max. drying temperature can reach 160°C.

RS485 Communication interface

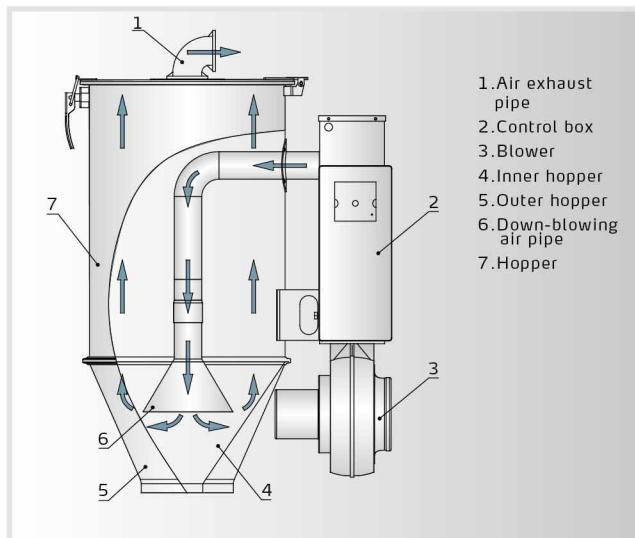

## Energy efficient

Compared with the test of standard SHD hopper dryer, the drying effect of SEHD increased by 60% on average, while the power consumption decreased by 40%.

## Working Principle

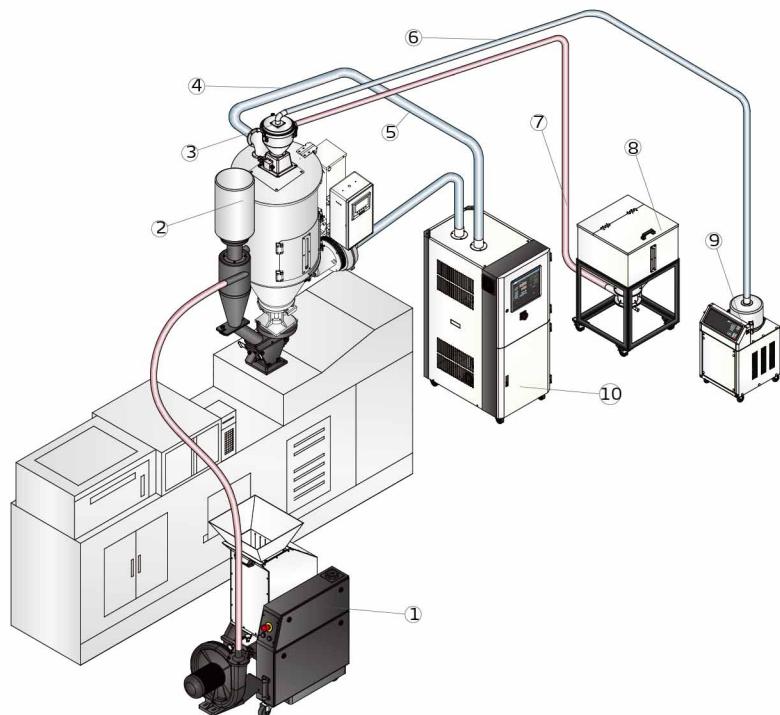

The air blown out by the blower is heated by electric heating to form the high-temperature dry hot air. Through down-blowing air pipe and hopper bell, the hot air can be evenly blown upward from the hopper bottom. The plastic materials absorb the heat in the air, and the drying air temperature gradually decreases, so the temperature of materials at lower part of the drying hopper is higher than that in the upper part. The material enters the drying hopper from the upper part and is excluded from the bottom as

## Application

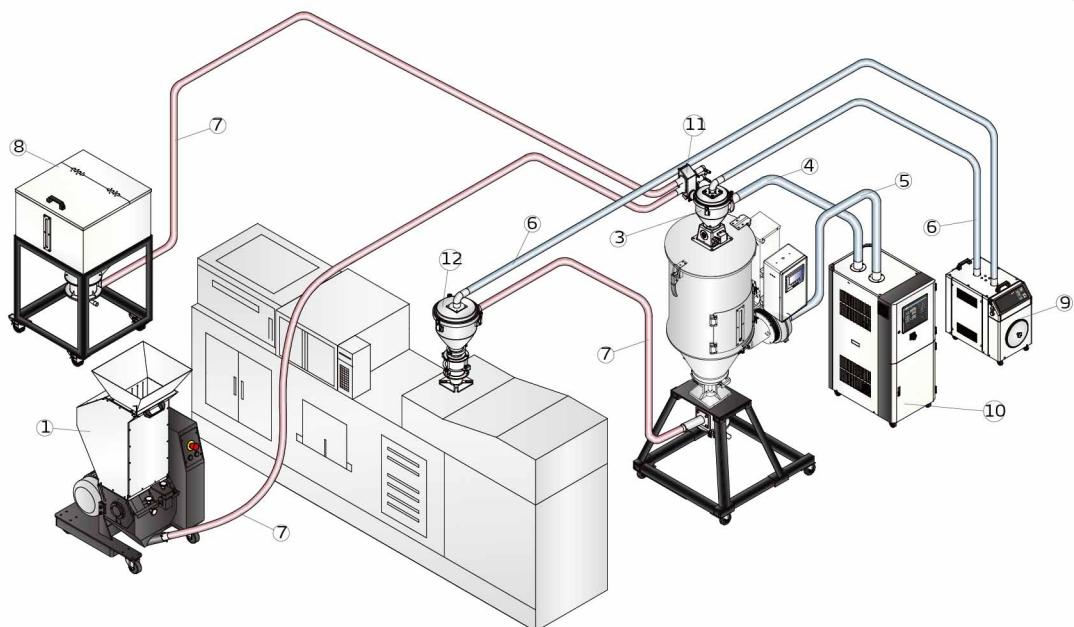

The SEHD energy-efficient hopper dryer can be used for drying most non-hygroscopic materials, such as PS, PP, ABS, etc. The maximum drying temperature can reach 160°C and it also can choose the optional double-layer insulation model to obtain uniform hopper temperature with less heat losses. Besides, multiple components are available as options that can recycle the hot air and filter the iron impurities in the material, which also can be installed on the ground with the floor stand.

# SEHD Series

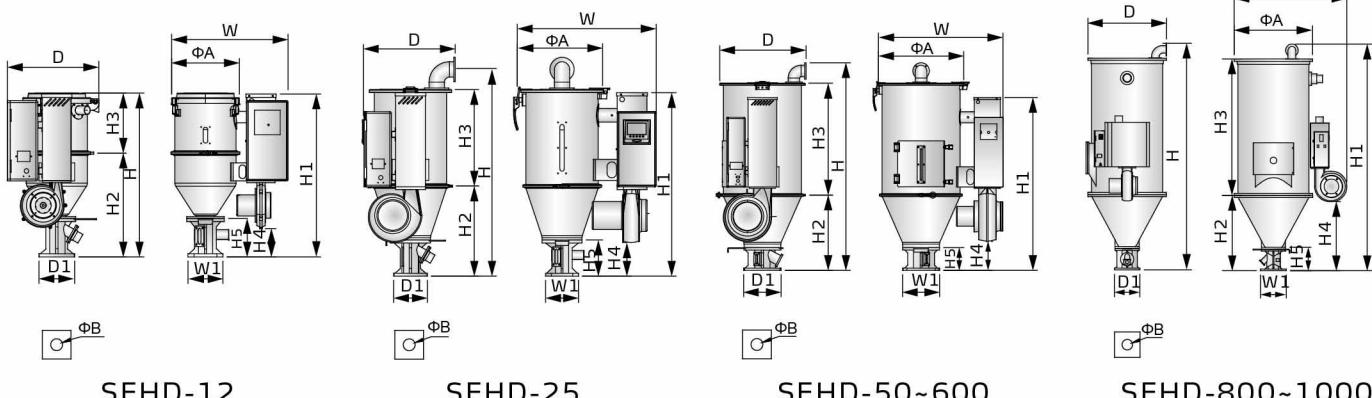

Direct Mounting (SEHD-300 and below models)

- 1.Low-speed granulator
- 2.30-sec instant recycle
- 3.Vacuum hopper
- 4.Return air
- 5.Dehumidifying air
- 6.Vacuum pipe
- 7.Material pipe
- 8.Material tank
- 9.Auto loader
- 10.Honeycomb dehumidifier
- 11.Proportional valve
- 12.Photosensor hopper

Floor Stand Mounting (SEHD-400 and above models)

## ■ Outline Drawings
